# GUN REMEDY

cleaning | lubricating | preservative

**You Deserve the Best...**

## One product for 3 steps:

- **Cleans thoroughly**
- **Lubricates**
- **Long-term protection against corrosion**
- **For all types of firearms**
- **Repels water, no dust accumulation**
- **Tested and recommended by professionals**

The Gun Remedy is a special product prepared by Česká zbrojovka a.s. for cleaning, lubrication and preserving of firearms. The product is suitable for all types of firearms: air soft, rimfire rifles, handguns, hunting and sport rifles, automatic weapons...

The Gun Remedy belongs to the group under the title of CLP, which stands for Cleaning, Lubrication and Preservative. One product combines functions of cleaning, lubrication and anti-corrosive protection into one step. The cleaning runs by physical means, but very quickly and with high efficiency. This product excels in capillarity and for this reason it can get even to the most inaccessible places, where other preparations have difficulty to penetrate. Air-drying of this product goes in two stages.

At the first stage (the quick one) the organic impurities are dissolved, and these are released from the firearm surface. Simultaneously, the high vapour pressure leads to so called "blow" of insoluble impurities out of the surface and their dispersion in the agent. There is also increase in viscosity and reduction in run-off.

At the second stage of drying (the slower phase) the impurities are dissolved and dispersed in the agent. Impurities do not retroactive in deposits and can be smoothly wiped out by moderately absorbing mate-

rial. Simultaneously, there is a reaction of corrosion inhibitors with the firearm's damaged surface and to its protection against corrosion. After drying the firearm's surface is covered with microfilm, which when touched is not greasy or oily, but "dry". The firearm is then very comfortable to hold and handle... Protective microfilm mentioned fulfils a number of practical functions: it has lubricating capacity and at the same time protects against corrosion.

Lubricating components of the Gun Remedy employ the world-unique principle. According to the NATO standards the lubricants in the idle state, at the required temperature range should be solid, however when in any place subjected to pressure or friction (e.g. barrel recoil) they should immediately liquefy and thus ensure reliable operation. Formed microfilm is not accumulating dust and other dirt, repels water.

Anti-corrosion and preserving efficiency of this product reaches the level of the single-purpose high quality preserving oils, which are intended only for firearms preserving and storing. Its scope and protective effect covers all steel and non-ferrous metals and is friendly to other types of material such as plastics, rubber or lacquered wood.

Application: Cleaning and care of the firearm is carried out in a simple way. For the aerosol version the agent is sprayed in sufficient quantity on a firearm and left to work for the first stage period of evaporation. Exposure time depends on ambient temperature and of the firearm itself, but also on the degree of fouling. This goes in the order of seconds or tens of seconds. In case of very heavy fouling or dirt, it is necessary to apply the product for even more times. Afterwards the firearm surface is wiped with clean cloth and left to dry. Eventually you can also spray the Gun Remedy on a cloth and saturate it. Using such a cloth and apply amply the Gun Remedy on the firearm surface in such a way so the product can run into and rise to joints and gaps. The product is let to work again for the time of the first stage of drying. Then the surface is wiped with dry cloth and let to get dry. For the drop-per version (so-called hand oiler) the procedure differs only in that that the oil drops must be applied to the whole surface of the firearm or the cloth is saturated, and the further procedure is the same as described above.

Repeated application of Gun Remedy makes all subsequent cleanings much easier when compared to other products. This product makes maintenance easier, reduces the length of time needed for cleaning and preservation of the firearm.

Technical description: the Gun Remedy is light yellow to light brown liquid of low viscosity. It is a blend of highly refined liquid hydrocarbons, corrosion inhibitors, lubricants and other additives. The product is available in aerosol version with a practical applicator in an attractive design or non-pressure package as a hand oiler with a practical applicator.

The Gun Remedy delivers superior and practical user comfort, guaranteed result and quality. Professional product available to all users. Česká zbrojovka truly holds the conviction that you deserve the best!
